### **Document Revision History**

Revision	Date	Description	Changed by
0	7/8/2009	Initial Release	CL
1	7/10/2009	Mechanical Drawing updated	BE
2	9/8/2009	Backlight supply current	BE
3	10/9/2009	Updated Electrical Characteristics	MC
4	12/9/2009	Updated Backlight Power supply and Current	MC

### **Functions and Features**

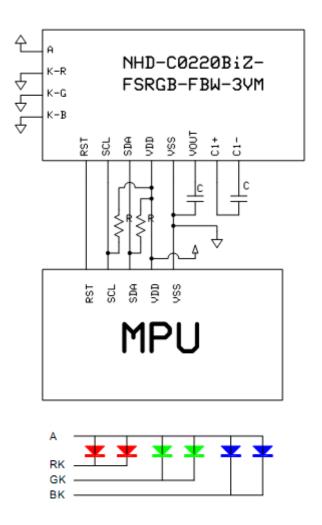

- 2 lines x 20 characters
- Built-in ST7036i controller with I2C interface
- 3.3V power supply
- 1/16 duty, 1/5 bias
- Built-in DC supply for VLCD (requires 2 external capacitors)

### **Pin Description and Wiring Diagram**

Pin No.	Symbol	External	Function Description
		Connection	
1	RST	MPU	Active LOW Reset
2	SCL	MPU	Serial Clock (requires pull-up resistor)
3	SDA	MPU	Serial Data (requires pull-up resistor)
4	VSS	Power Supply	GND
5	VDD	Power Supply	+3.3V
6	VOUT	CAP	Voltage booster circuit – connect to 1uF cap to VSS or VDD
7	C1+	CAP	Connect to 1uF cap to PIN8
8	C1-	CAP	Connect to 1uF cap to PIN7

**Recommended LCD connector:** 2.0mm pitch pins, solder directly into PCB **Backlight connector:** 3.0mm pitch pins, solder directly into PCB **Mates with:** ---

Capacitance 0.47uF~2.2uF

Recommended value = 1uF

# **Electrical Characteristics**

Item	Symbol	Condition	Min.	Тур.	Max.	Unit
Operating Temperature Range	Тор	Absolute Max	-20	-	+70	°C
Storage Temperature Range	Tst	Absolute Max	-30	-	+80	°C
Supply Voltage	VDD		2.7	3.3	3.5	V

### **Controller Information**

Built-in ST7036i. Download specification at <a href="http://www.newhavendisplay.com/app\_notes/ST7036.pdf">http://www.newhavendisplay.com/app\_notes/ST7036.pdf</a>

### Slave Address = 0x78

### **Table of Commands**

Instruction			Ir	str	ucti	on	Coc	le			Description
mstruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description
Clear Display	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM. and set DDRAM address to "00H" from AC
Return Home	0	0	0	О	0	0	0	0	1	x	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	S	Sets cursor move direction and specifies display shift. These operations are performed during data write and read.
Display ON/OFF	0	0	0	0	0	0	1	D	С	В	D=1:entire display on C=1:cursor on B=1:cursor position on
Function Set	0	0	0	О	1	DL	N	DH	IS2	IS1	DL: interface data is 8/4 bits N: number of line is 2/1 DH: double height font IS[2:1]: instruction table select
Set DDRAM Address	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter
Read Busy Flag and Address	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Whether during internal operation or not can be known by reading BF. The contents of address counter can also be read.
Write Data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM/ICONRAM)
Read Data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM/ICONRAM)

	Instruction table 0(IS[2:1]=[0,0])													
Cursor or Display Shift	0	0	0	0	0	1	S/C	R/L	x	x	S/C and R/L: Set cursor moving and display shift control bit, and the direction, without changing DDRAM data.			
Set CGRAM	0	0	0	1	AC5	AC4	AC3	AC2	AC1	IAC0	Set CGRAM address in address counter			

						Ins	truc	tior	ı tal	ble	1(IS[2:1]=[0,1])
Bias Set	0	0	1	BS	1	0	FX	BS=1:1/4 bias BS=0:1/5 bias FX: fixed on high in 3-line application and fixed on low in other applications.			
Set ICON Address	0	0	0	1	0	0	AC3	AC2	AC1	AC0	Set ICON address in address counter.
Power/ICON Control/ Contrast Set	0	0	0	1	О	1	Ion	Bon	C5	C4	lon: ICON display on/off Bon: set booster circuit on/off C5,C4: Contrast set for internal follower mode.
Follower Control	0	0	0	1	1	0	Fon	Rab 2	Rab 1	Rab 0	Fon: set follower circuit on/off Rab2~0: select follower amplified ratio.
Contrast Set	0	0	0	1	1	1	СЗ	C2	C1	00	Contrast set for internal follower mode.

	Instruction table 2(IS[2:1]=[1,0])													
Double Height Position Select	0	0	О	О	О	1	UD	x	x	x	UD: Double height position select			
Reserved	0	0	0	1	x	x	x	x	x	x	Do not use (reserved for test)

### **Quality Information**

Test Item	Content of Test	Test Condition	Note
High Temperature storage	Endurance test applying the high storage temperature for a long time.	+80°C , 200hrs	2
Low Temperature storage	Endurance test applying the low storage temperature for a long time.	-30°C , 200hrs	1,2
High Temperature Operation	Endurance test applying the electric stress (voltage & current) and the high thermal stress for a long time.	+70°C 200hrs	2
Low Temperature Operation	Endurance test applying the electric stress (voltage & current) and the low thermal stress for a long time.	-20°C , 200hrs	1,2
High Temperature / Humidity Operation	Endurance test applying the electric stress (voltage & current) and the high thermal with high humidity stress for a long time.	+60°C, 90% RH, 96hrs	1,2
Thermal Shock resistance	Endurance test applying the electric stress (voltage & current) during a cycle of low and high thermal stress.	-20°C,30min -> 25°C,5min -> 70°C,30min = 1 cycle 10 cycles	
Vibration test	Endurance test applying vibration to simulate transportation and use.	10-55Hz , 15mm amplitude. 60 sec in each of 3 directions X,Y,Z For 15 minutes	3
Static electricity test	Endurance test applying electric static discharge.	VS=800V, RS=1.5k $\Omega$ , CS=100pF One time	

Note 1: No condensation to be observed.

Note 2: Conducted after 4 hours of storage at 25°C, 0%RH.

**Note 3:** Test performed on product itself, not inside a container.

ST7036

Dot Matrix LCD Controller/Driver

#### ■ Features

- 5 x 8 dot matrix possible
- Low power operation support:
  - -- 2.7 to 5.5V
- Range of LCD driver power
   -- 3.0 to 7.0V
- 4-bit, 8-bit, serial or I<sup>2</sup>C-bus MPU interface enabled
- 80 x 8-bit display RAM (80 characters max.)
- 10,240-bit character generator ROM for a total of 256 character fonts(max)
- 64 x 8-bit character generator RAM(max)
- Support two display mode:
   16-com x 100-seg and 80 ICON
   24-com x 80-seg and 80 ICON
- 16 x 5 -bit ICON RAM(max)

Wide range of instruction functions:
 Display clear, cursor home, display on/off, cursor on/off, display character blink, cursor

shift, display shift, double height font

- Automatic reset circuit that initializes the controller/driver after power on and external reset pin
- Internal oscillator(Frequency=540kHz) and external clock
- Built-in voltage booster and follower circuit (low power consumption)
- COM/SEG direction selectable
- Multi-selectable for CGRAM/CGROM size
- Instruction compatible to ST7066U and KS0066U and HD44780
- Available in COG type

### **■** Description

The ST7036 dot-matrix liquid crystal display controller can display alphanumeric, Japanese kana characters, and symbols. It can be configured to drive a dot-matrix liquid crystal display under the control of a 4\_/ 8-bit with 6800-series, serial or fast I<sup>2</sup>C interface microprocessor. Since all the functions such as display RAM, character generator ROM/RAM and liquid crystal driver, required for driving a dot-matrix liquid crystal display are internally provided on one chip, a minimal system can be used with this controller/driver.

The ST7036 character generator ROM size is 256 5x8dot bits which can be used to generate 256 different character fonts (5x8dot).

The ST7036 is suitable for low voltage supply (2.7V to 5.5V) and is perfectly suitable for any portable product which is driven by the battery and requires low power consumption.

The display resolution of ST7036 dot-matrix\_LCD driver can be either 1-line x 20 characters, 2-line x 20 characters or 3-line x 16 characters with 80 bit ICON.

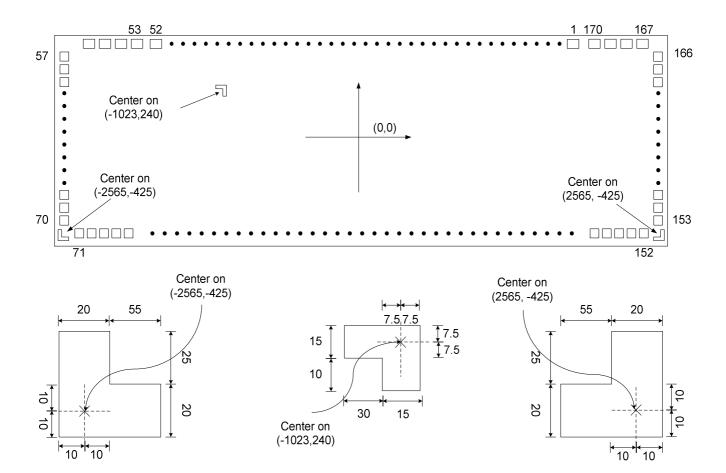

The ST7036 dot-matrix LCD driver does not need extra cascaded drivers.

product Name	Character generator ROM Size	OPR1	OPR2	Support Character

**■** EXT option pin difference table

Mode Difference	Normal mode (EXT=1) (Instruction compatible to ST7066U)	Extension mode (EXT=0)
Booster	Always OFF	ON/OFF controlled by instruction
, ,	Can't use the follower circuit Only use external resistor or internal resistor(1/5 bias)	Follower or internal/external resistor selectable
Contrast adjust	Control by external VR	Controlled by instruction with follower     Controlled by external VR with internal/external resistor
ICON RAM	Can't be use	RAM size has 80 bit width(S1~S80).
Instruction	Control normal instruction similar to ST7066U.	Control extension instruction for low power consumption.
Double height font	Only 5x8 font	Can set 5x8 or 5x16 font

### **■** Function Description

#### System Interface

This chip has all four kinds of interface type with MPU: 4-bit bus, 8-bit bus, serial and fast I<sup>2</sup>C interface. 4-bit bus or 8-bit bus is selected by DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. One is data register (DR), the other is instruction register(IR).

The data register(DR) is used as temporary data storage place for being written into or read from DDRAM/CGRAM/ICON RAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. So to speak, after MPU reads DR data, the data in the next DDRAM/CGRAM/ICON RAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM/ICON RAM automatically.

The Instruction register(IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

To select register, use RS input pin in 4-bit/8-bit bus mode.

RS	R/W	Operation
L	Г	Instruction Write operation (MPU writes Instruction code into IR)
L	Н	Read Busy Flag(DB7) and address counter (DB0 ~ DB6)
Н	L	Data Write operation (MPU writes data into DR)
Н	Н	Data Read operation (MPU reads data from DR)

Table 1. Various kinds of operations according to RS and R/W bits.

#### I<sup>2</sup>C interface

It just only could write Data or Instruction to ST7036 by the IIC Interface. It could not read Data or Instruction from ST7036 (except Acknowledge signal).

SCL: serial clock input SDA\_IN: serial data input

SDA\_OUT: acknowledge response output

Slaver address could set from "0111100" to "0111111".

The I<sup>2</sup>C interface send RAM data and executes the commands sent via the I<sup>2</sup>C Interface. It could send data in to the RAM. The I<sup>2</sup>C Interface is two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

#### **BIT TRANSFER**

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes in the data line at this time will be interpreted as a control signal. Bit transfer is illustrated in Fig.1.

#### START AND STOP CONDITIONS

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Fig.2.

#### **SYSTEM CONFIGURATION**

The system configuration is illustrated in Fig.3.

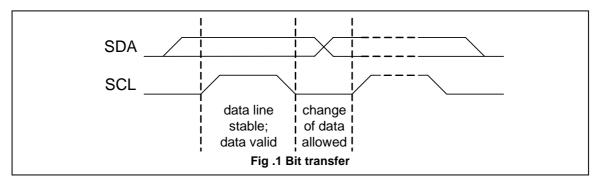

- · Transmitter: the device, which sends the data to the bus
- · Master: the device, which initiates a transfer, generates clock signals and terminates a transfer
- · Slave: the device addressed by a master
- · Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message

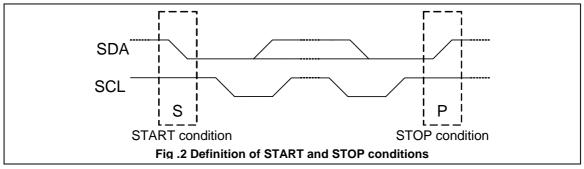

- Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted
- · Synchronization: procedure to synchronize the clock signals of two or more devices.

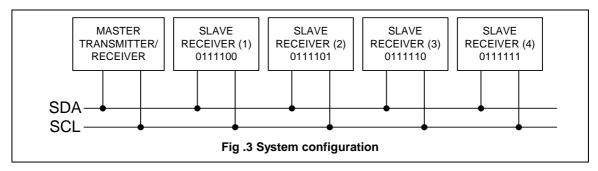

#### **ACKNOWLEDGE**

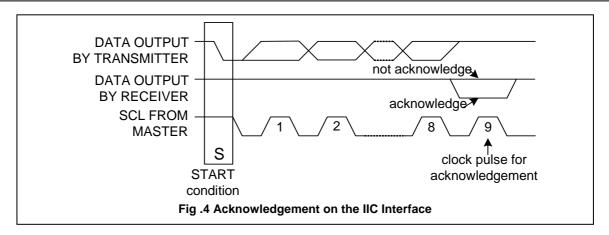

#### Acknowledge signal (ACK) is not BF signal in parallel interface.

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. A master receiver must also generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the I<sup>2</sup>C Interface is illustrated in Fig.4.

#### I<sup>2</sup>C Interface protocol

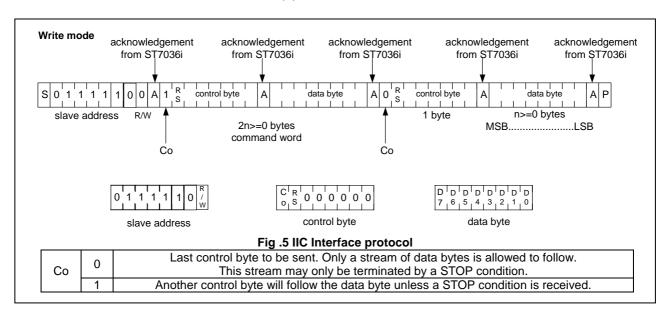

The ST7036 supports command, data write addressed slaves on the bus.

Before any data is transmitted on the I<sup>2</sup>C Interface, the device, which should respond, is addressed first. Four 7-bit slave addresses (01111**00** to 01111**11**) are reserved for the ST7036. The R/W is assigned to 0 for Write only. The I<sup>2</sup>C Interface protocol is illustrated in Fig.5.

The sequence is initiated with a START condition (S) from the  $I^2C$  Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the  $I^2C$  Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of a control byte, which defines Co and RS, plus a data byte.

The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After a control byte with a cleared Co bit, only data bytes will follow. The state of the RS bit defines whether the data byte is interpreted as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the RS bit setting; either a series of display data bytes or command data bytes may follow. If the RS bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended ST7036i device. If the RS bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the I<sup>2</sup>C INTERFACE-bus master issues a STOP condition (P).

During write operation, two 8-bit registers are used. One is data register (DR), the other is instruction register(IR).

The data register(DR) is used as temporary data storage place for being written into DDRAM/CGRAM/ICON RAM, target RAM is selected by RAM address setting instruction. Each internal operation, writing into RAM, is done automatically. So to speak, after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM/ICON RAM automatically.

The Instruction register(IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

To select register, use RS bit input in IIC interface.

RS	R/W Operation								
L	L	Instruction Write operation (MPU writes Instruction code into IR)							
Н	L	Data Write operation (MPU writes data into DR)							

Table 2. Various kinds of operations according to RS and R/W bits.

#### Busy Flag (BF)

When BF = "High", it indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read, when RS = Low and R/W = High (Read Instruction Operation), through DB7 port. Before executing the next instruction, be sure that BF is not High.

#### Address Counter (AC)

Address Counter(AC) stores DDRAM/CGRAM/ICON RAM address, transferred from IR.

After writing into (reading from) DDRAM/CGRAM/ICON RAM, AC is automatically increased (decreased) by 1.

When RS = "Low" and R/W = "High", AC can be read through DB0 ~ DB6 ports.

#### Display Data RAM (DDRAM)

Display data RAM (DDRAM) stores display data represented in 8-bit character codes. Its extended capacity is 80 x 8 bits, or 80 characters. The area in display data RAM (DDRAM) that is not used for display can be used as general data RAM. See Figure 6 for the relationships between DDRAM addresses and positions on the liquid crystal display.

The DDRAM address (ADD) is set in the address counter (AC) as hexadecimal.

#### 1-line display (N3=0,N = 0) (Figure 7)

When there are fewer than 80 display characters, the display begins at the head position. For example, if using only the ST7036, 20 characters are displayed. See Figure 7. When the display shift operation is performed, the DDRAM address shifts. See Figure 8.

Fig. 6 DDRAM Address

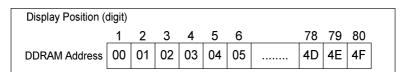

Fig. 7 1-Line Display

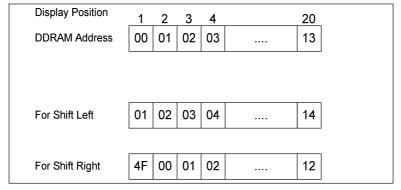

Fig. 8 1-Line by 20-Character Display Example

#### > 2-line display (N3=0,N = 1) (Figure 9)

Case 1: When the number of display characters is less than  $40 \times 2$  lines, the two lines are displayed from the head. Note that the first line end address and the second line start address are not consecutive. For example, when just the ST7036 is used, 20 characters  $\times 2$  lines are displayed. See Figure 9. When display shift operation is performed, the DDRAM address shifts. See Figure 10.

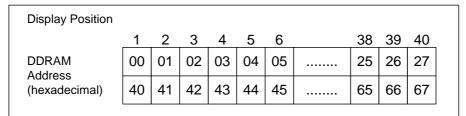

Fig. 9 2-Line Display

Display Position	1	2	3	4	5	6	7	8		17	18	19	20

#### Character Generator ROM (CGROM)

The character generator ROM generates 5 x 8 dot character patterns from 8-bit character codes. It can generate 240/250/248/256 5 x 8 dot character patterns (select by OPR1/2 ITO pin). User-defined character patterns are also available by mask-programmed ROM.

#### Character Generator RAM (CGRAM)

In the character generator RAM, the user can rewrite character patterns by program. For 5 x 8 dots, eight character patterns can be written.

Write into DDRAM the character codes at the addresses shown as the left column of Table 5 to show the character patterns stored in CGRAM.

See Table 5 for the relationship between CGRAM addresses and data and display patterns. Areas that are not used for display can be used as general data RAM.

#### ICON RAM

In the ICON RAM, the user can rewrite icon pattern by program.

There are totally 80 dots for icon can be written.

See Table 6 for the relationship between ICON RAM address and data and the display patterns.

#### Timing Generation Circuit

The timing generation circuit generates timing signals for the operation of internal circuits such as DDRAM, CGROM and CGRAM. RAM read timing for display and internal operation timing by MPU access are generated separately to avoid interfering with each other. Therefore, when writing data to DDRAM, for example, there will be no undesirable interference, such as flickering, in areas other than the display area.

#### LCD Driver Circuit(N3=0)

LCD Driver circuit has 17 common and 100 segment signals for LCD driving. Data from CGRAM/CGROM/ICON is transferred to 100 bit segment latch serially, and then it is stored to 100 bit shift latch. When each common is selected by 17 bit common register, segment data also output through segment driver from 100 bit segment latch. In case of 1-line display mode, COM1 ~ COM8(with COMI) have 1/9 duty, and in 2-line mode, COM1 ~ COM16(with COMI) have 1/17 duty ratio.

#### LCD Driver Circuit(N3=1)

LCD Driver circuit has 25 common and 80 segment signals for LCD driving. Data from CGRAM/CGROM/ICON is transferred to 80 bit segment latch serially, and then it is stored to 80 bit shift latch. When each common is selected by 25 bit common register, segment data also output through segment driver from 80 bit segment latch. In case of 3-line display mode, COM1 ~ COM24(with COMI) have 1/25 duty.

Table 3. COM/SEG output define

#### Cursor/Blink Control Circuit

It can generate the cursor or blink in the cursor/blink control circuit. The cursor or the blink appears in the digit at the display data RAM address set in the address counter.

Table 5 Relationship between CGRAM Addresses, Character Codes (DDRAM) and Character patterns (CGRAM Data)

#### Notes:

- 1. Character code bits 0 to 2 correspond to CGRAM address bits 3 to 5 (3 bits: 8 types).
- 2. CGRAM address bits 0 to 2 designate the character pattern line position. The 8th line is the cursor position and its display is formed by a logical OR with the cursor. Maintain the 8th line data, corresponding to the cursor display position, at 0 as the cursor display. If the 8th line data is 1, 1 bits will light up the 8th line regardless of the cursor presence.
- 3. Character pattern row positions correspond to CGRAM data bits 0 to 4 (bit 4 being at the left).
- 4. As shown Table 5, CGRAM character patterns are selected when character code bits 4 to 7 are all 0. However, since character code bit 3 has no effect, the T display example above can be selected by either character code 00H or 08H.
- 5. "1" for CGRAM data corresponds to display selection and "0" to non-selection, "-" Indicates no effect.
- 6. Different OPR1/2 ITO option can select different CGRAM size.

When ICON RAM data is filled the corresponding position displayed is described as the following table.

When SHLS=1, ICON RAM map refer below table

Table 6 ICON RAM map

### **■** Instructions

There are four categories of instructions that:

- Designate ST7036 functions, such as display format, data length, etc.
- Set internal RAM addresses
- Perform data transfer with internal RAM
- Others

#### instruction table at "Normal mode"

(when "EXT" option pin connect to VDD, the instruction set follow below table)

Write Data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM)	26.3 µs	18.5 µs	14.3 µs
Read Data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM)	26.3 µs	18.5 µs	14.3 µs

#### Note:

Be sure the ST7036 is not in the busy state (BF = 0) before sending an instruction from the MPU to the ST7036. If an instruction is sent without checking the busy flag, the time between the first instruction and next instruction will take much longer than the instruction time itself. Refer to Instruction Table for the list of each instruction execution time.

### instruction table at "Extension mode"

(when "EXT" option pin connect to Vss, the instruction set follow below table)

Instruction			Ir	nstr	ucti	ion	Coc	le			Description		nstructio ecution T	
IIISti detion	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	OSC= 380kHz	OSC= 540kHz	OSC= 700kHz
Clear Display	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM. and set DDRAM address to "00H" from AC	1.08 ms	0.76 ms	0.59 ms
Return Home	0	0	0	0	0	0	0	0	1	х	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.	1.08 ms	0.76 ms	0.59 ms

## **■** Instruction Description

#### Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

#### Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	X

Return Home is cursor return home instruction. Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM does not change.

#### Entry Mode Set

RS R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0 0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

#### I/D : Increment / decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

\* CGRAM operates the same as DDRAM, when read from or write to CGRAM.

#### S: Shift of entire display

When DDRAM read (CGRAM read/write) operation or S = "Low", shift of entire display is not performed. If S = "High" and DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1" : shift left, I/D = "0" : shift right).

S	I/D	Description
Н	Н	Shift the display to the left
Н	L	Shift the display to the right

#### Display ON/OFF

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	С	В

Control display/cursor/blink ON/OFF 1 bit register.

#### > D: Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

#### > C: Cursor ON/OFF control bit

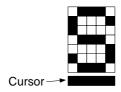

When C = "High", cursor is turned on.

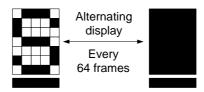

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

#### > B: Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position.

When B = "Low", blink is off.

#### Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	X	X

#### > S/C: Screen/Cursor select bit

When S/C="High", Screen is controlled by R/L bit.

When S/C="Low", Cursor is controlled by R/L bit.

#### > R/L: Right/Left

When R/L="High", set direction to right.

When R/L="Low", set direction to left.

Without writing or reading of display data, shift right/left cursor position or display. This instruction is used to correct or search display data. During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line. Note that display shift is performed simultaneously in all the line. When displayed data is shifted repeatedly, each line shifted individually. When display shift is performed, the contents of address counter are not changed.

S/C	R/L	Description	AC Value
L	L	Shift cursor to the left	AC=AC-1
L	Н	Shift cursor to the right	AC=AC+1
Н	L	Shift display to the left. Cursor follows the display shift	AC=AC
Н	Н	Shift display to the right. Cursor follows the display shift	AC=AC

#### Function Set

RS	R/W	DE	7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0		0	1	DL	N	DH	IS2	IS1

#### DL : Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data by two times.

#### N: Display line number control bit

When N = "High", 2-line display mode is set.

When N = "Low", it means 1-line display mode.

When "N3" option pin connect to VDD, N must set "N=1".

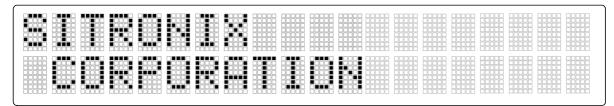

#### > DH : Double height font type control bit

When DH = "High" and N= "Low", display font is selected to double height mode (5x16 dot), RAM address can only use 00H-27H.

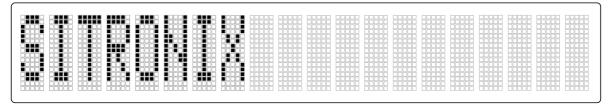

When DH= "High" and N= "High", it is forbidden.

When DH = " Low ", display font is normal (5x8 dot).

N	DH	•	in connect to gh	EXT option pin connect to low			
IN	ИΠ	Display Lines	Character Font	Display Lines	Character Font		
L	L	1	5x8	1	5x8		
L	Н	1	5x8	1	5x16		
Н	L	2	5x8	2	5x8		
Н	Н	2 5x8 Forbidden					

2 line mode normal display (DH=0/N=1)

1 line mode with double height font (DH=1/N=0)

#### ► IS[2:1]: instruction table select

When IS[2:1]=(0,0): normal instruction be selected(refer instruction table 0)

When IS[2:1]=(0,1):extension instruction be selected(refer instruction table 1)

When IS[2:1]=(1,0):extension instruction be selected(refer instruction table 2)

When IS[2:1]=(1,1):Do not use (reserved for test)

### Double height position set: IS[2:1]=(1,0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	UD	Х	X	X

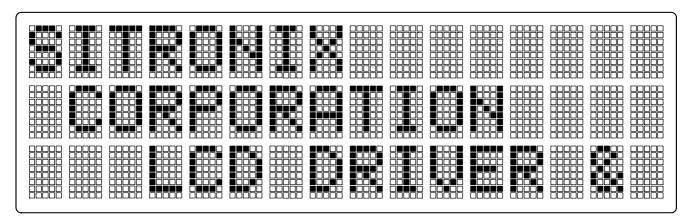

#### > UD: Select double height font display position of screen.(N3=VDD)

When UD = "High", double height font is show on Com1~Com16.

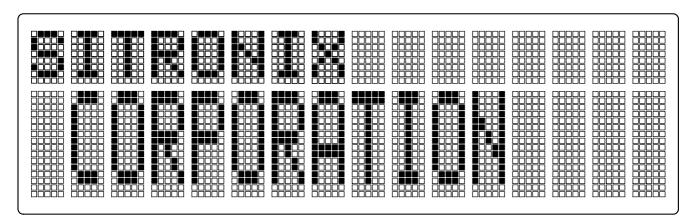

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	AC3	AC2	AC1	AC0

When UD = "Low", double height font is show on Com9~Com24.

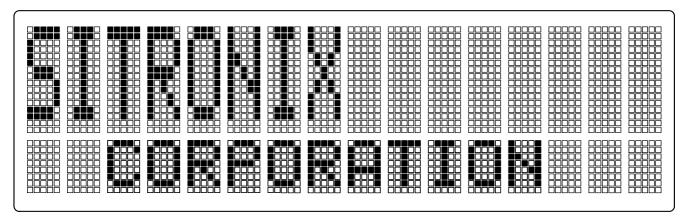

DH	UD	2 LINES(N3=VSS)	3 LINES(N3=VDD)
Н	Н	Com1~Com16 Double Height	Com1~Com16 Double Height Com17~Com24 Normal Display
Н	L	Com1~Com16 Double Height	Com1~Com8 Normal Display Com9~Com24 Double Height
L	X	Normal Display	Normal Display

3 Line mode normal display (DH = 0 / N = 1 / UD = don't care)

COM1 ..8 is normal , COM9 .. 24 is a double height font (DH = 1 / N = 1 / UD = 0)

COM17 ..24 is normal, COM1 .. 16 is a double height font (DH = 1 / N = 1 / UD = 1)

#### Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

#### Set DDRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N = 0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N = 1), DDRAM address in the 1st line is from "00H" to "27H", and

DDRAM address in the 2nd line is from "40H" to "67H".

In 3-line display mode (N3=1, N=1), DDRAM address in the 1st line is from "00H" to "OFH", DDRAM in the 2nd line is from "10H" to "1FH", and DDRAM in the 3rd line is from "20H" to "2FH".

#### Read Busy Flag and Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

When BF = "High", indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted.

The address Counter (AC) stores DDRAM/CGRAM addresses, transferred from IR.

After writing into (reading from) DDRAM/CGRAM, AC is automatically increased (decreased) by 1.

#### Write Data to CGRAM, DDRAM or ICON RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to CGRAM, DDRAM or ICON RAM

The selection of RAM from DDRAM, CGRAM or ICON RAM, is set by the previous address set instruction : DDRAM address set, CGRAM address set, ICON RAM address set. RAM set instruction can also determine the AC

direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

#### Read Data from CGRAM, DDRAM or ICON RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM./ICON RAM

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data.

#### Bias Set

RS	R/W	 DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	BS	1	0	FX

#### BS: bias selection

When BS="High", the bias will be 1/4

When BS="Low", the bias will be 1/5

BS will be invalid when external bias resistors are used(OPF1=1,OPF2=1)

**FX:** must be fixed on high in 3-line application and fixed on low in other applications.

#### Set ICON RAM address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	AC3	AC2	AC1	AC0

Set ICON RAM address to AC.

This instruction makes ICON data available from MPU.

When IS=1 at Extension mode,

The ICON RAM address is from "00H" to "0FH".

#### Power/ICON control/Contrast set(high byte)

RS	R/W	 DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	Іом	Вом	C5	C4

#### > Ion: set ICON display on/off

When Ion = "High", ICON display on.

When Ion = "Low", ICON display off.

#### > Bon: switch booster circuit

Bon can only be set when internal follower is used (OPF1=0,OPF2=0).

When Bon = "High", booster circuit is turn on.

When Bon = "Low", booster circuit is turn off.

#### C5,C4 : Contrast set(high byte)

C5,C4,C3,C2,C1,C0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can more precisely adjust the input reference voltage of V0 generator. The details please refer to the supply voltage for LCD driver.

#### Follower control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
	^	0	1	1	_	Eau	Rab	Rab	Rab
0	U	U	'	'	0	FON	2	1	0

#### Fon: switch follower circuit

Fon can only be set when internal follower is used (OPF1=0,OPF2=0).

When Fon = "High", internal follower circuit is turn on.

When Fon = "Low", internal follower circuit is turn off.

Note that Fon must be set to "Low" if (OPF1, OPF2) is not (0,0).

#### Rab2,Rab1,Rab0 : V0 generator amplified ratio

Rab2,Rab1,Rab0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can adjust the amplified ratio of V0 generator. The details please refer to the supply voltage for LCD driver.

#### Contrast set(low byte)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	1	СЗ	C2	C1	C0

#### C3,C2,C1,C0:Contrast set(low byte)

C5,C4,C3,C2,C1,C0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can more precisely adjust the input reference voltage of V0 generator. The details please refer to the supply voltage for LCD driver.

### ■ Reset Function

#### Initializing by Internal Reset Circuit

An internal reset circuit automatically initializes the ST7036 when the power is turned on. The following instructions are executed during the initialization. The busy flag (BF) is kept in the busy state (BF = 1) until the initialization ends. The busy state lasts for 40 ms after VDD rises to stable.

- 1. Display clear
- 2. Function set:

DL = 1; 8-bit interface data

N = 0; 1-line display

DH=0; normal 5x8 font

IS[2:1]=(0,0); use instruction table 0

- 3. Display on/off control:
  - D = 0; Display off
  - C = 0; Cursor off
  - B = 0; Blinking off
- 4. Entry mode set:

I/D = 1; Increment by 1

S = 0; No shift

5. 3 line: FX=1

1/2 line: FX=0

6. ICON control

Ion=0; ICON off

7. Power control

BS=0; 1/5bias

Bon=0; booster off

Fon=0; follower off

(C5,C4,C3,C2,C1,C0)=(1,0,0,0,0,0)

(Rab2,Rab1,Rab0)=(0,1,0)

8. Double Height Position Select

UD=0, double height font is show on Com9~Com24.

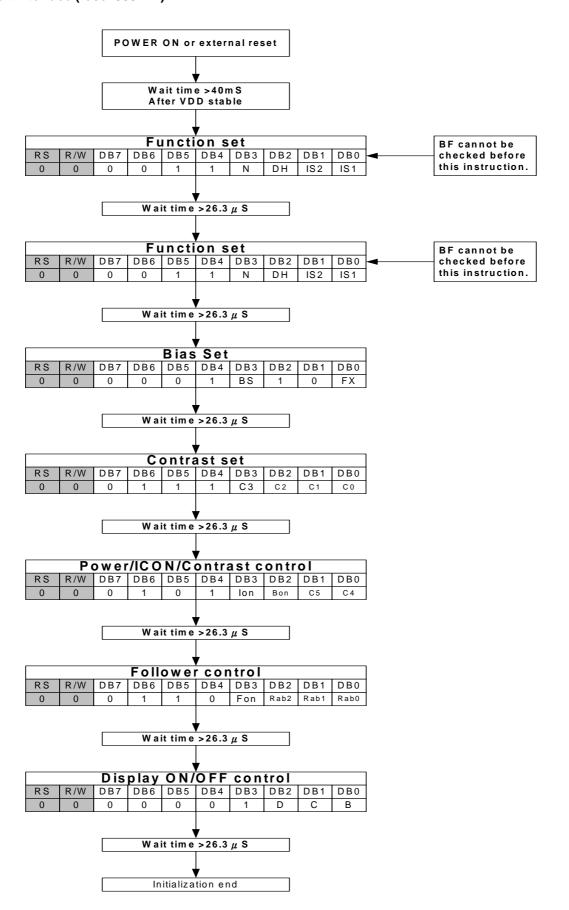

#### Note:

If the electrical characteristics conditions listed under the table Power Supply Conditions Using Internal Reset Circuit are not met, the internal reset circuit will not operate normally and will fail to initialize the ST7036.

When internal Reset Circuit not operate, ST7036 can be reset by XRESET pin from MPU control signal.

## Initializing by Instruction

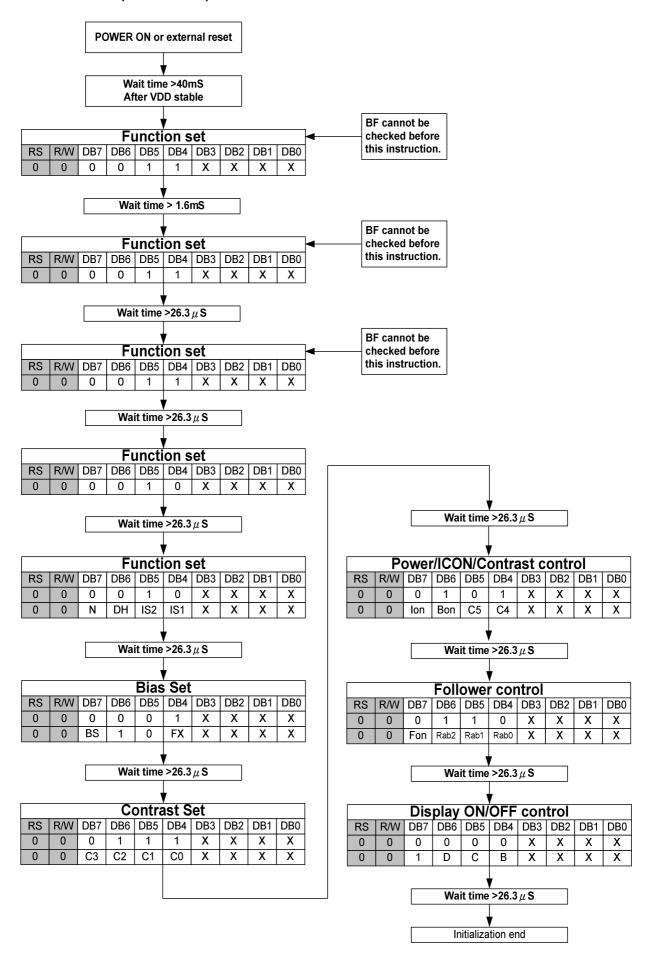

8-bit Interface (fosc=380kHz)

## > Initial Program Code Example For 8051 MPU(8 Bit Interface):

## ■ Interfacing to the MPU

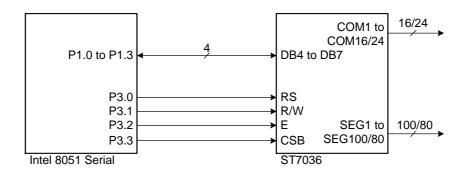

The ST7036 can send data in two 4-bit operations/one 8-bit operation, serial 1 bit operation or fast I<sup>2</sup>C operation, thus allowing interfacing with 4-bit, 8-bit or I<sup>2</sup>C MPU.

For 4-bit interface data, only four bus lines (DB4 to DB7) are used for transfer. Bus lines DB0 to DB3 are disabled. The data transfer between the ST7036 and the MPU is completed after the 4-bit data has been transferred twice. As for the order of data transfer, the four high order bits (for 8-bit operation, DB4 to DB7) are transferred before the four low order bits (for 8-bit operation, DB0 to DB3). The busy flag must be checked (one instruction) after the 4-bit data has been transferred twice. Two more 4-bit operations then transfer the busy flag and address counter data.

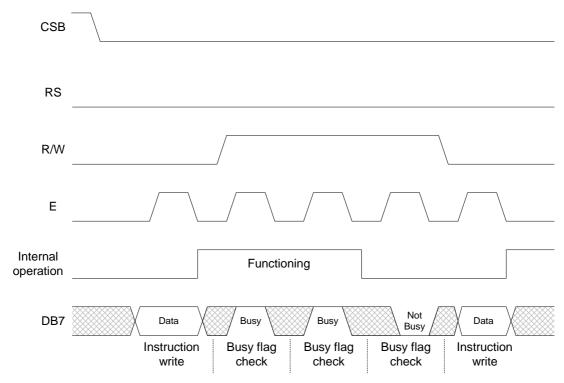

#### Example of busy flag check timing sequence

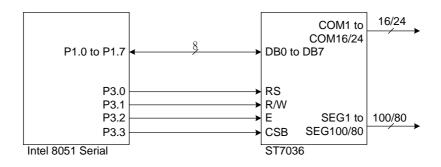

#### > Intel 8051 interface(4 Bit)

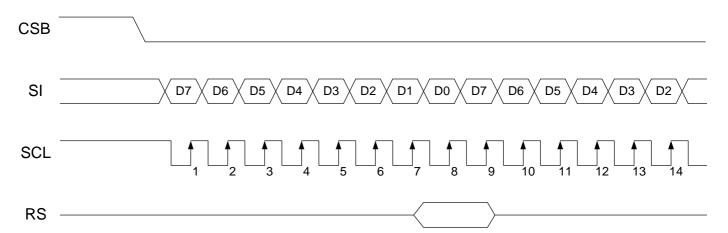

- For 8-bit interface data, all eight bus lines (DB0 to DB7) are used.
- Example of busy flag check timing sequence

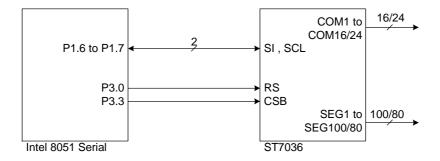

### > Intel 8051 interface(8 Bit)

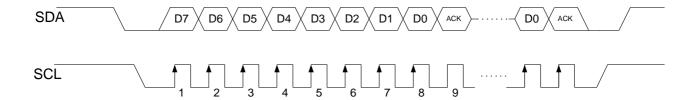

- For serial interface data, only two bus lines (DB6 to DB7) are used.
- Example of timing sequence

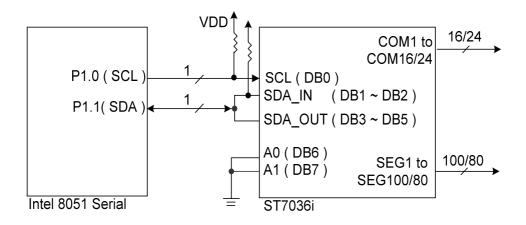

### > Intel 8051 interface ( Serial 4-line )

- For I<sup>2</sup>C interface data, all eight bus lines (DB0 to DB7) are used.
- > Example of timing sequence

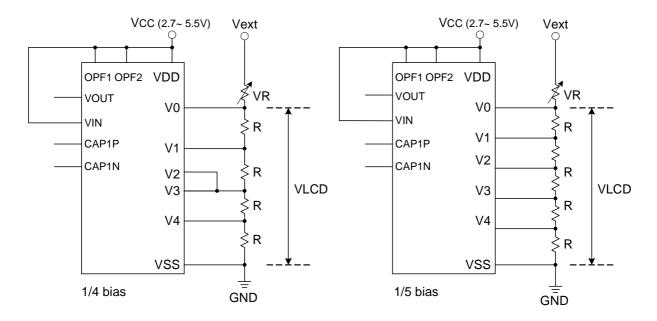

### Intel 8051 interface ( I<sup>2</sup>C interface )

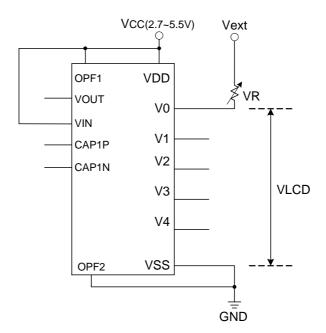

## ■ Supply Voltage for LCD Drive

 When external bias resistors are used (OPF1=1,OPF2=1)

 When built-in bias resistors(9.6KΩ) are used (OPF1=1,OPF2=0)

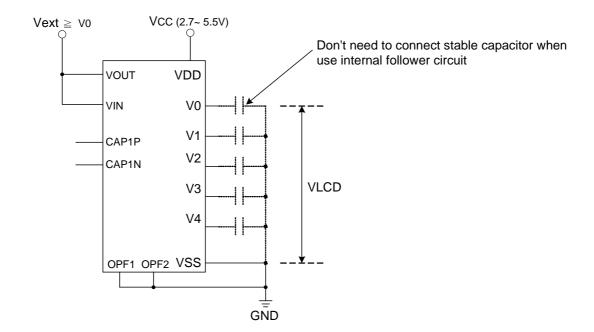

Note: Do not use built-in booster while built-in bias resistors are used.

 When built-in bias resistors(3.3KΩ) are used (OPF1=0,OPF2=1)

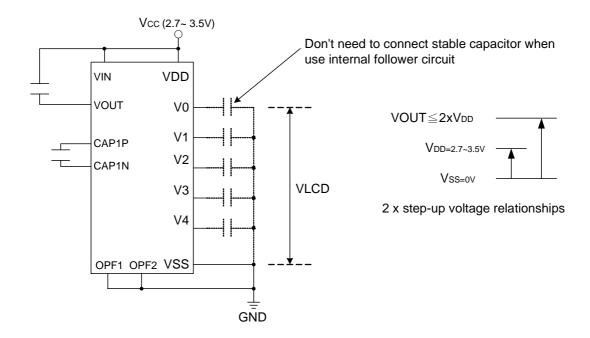

Note: Do not use built-in booster while built-in bias resistors are used.

 When built-in voltage followers with external Vout are used (OPF1=0,OPF2=0 and instruction setting Bon=0,Fon=1)

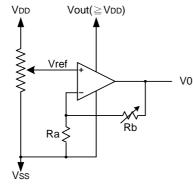

#### When built-in booster and voltage followers are used(OPF1=0,OPF2=0)

# Note: Ensure V0 level stable, that must let |Vout-V0| over 0.5V(if panel size over 4.5",the |Vout-V0| propose over 0.8V).

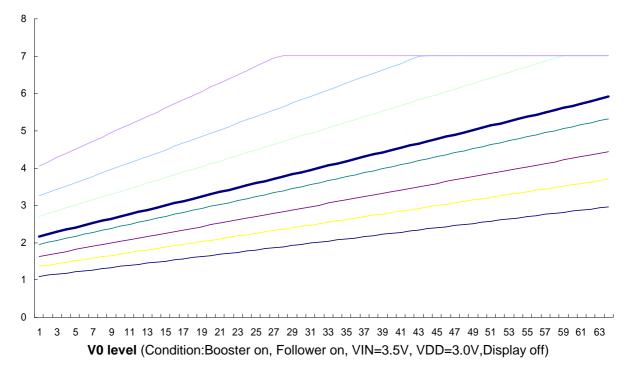

#### V0 voltage follower value calculation

V0=(1+ 
$$\frac{\text{Rb}}{\text{Ra}}$$
 ) x Vref  
While Vref=VDD x(  $\frac{\alpha+36}{100}$ )

C5	C4	C3	C2	C1	C0	α
0	0	0	0	0	0	0
0	0	0	0	0	1	1
0	0	0	0	1	0	2
			•			:
						:
1	1	1	1	0	1	61
1	1	1	1	1	0	62
1	1	1	1	1	1	63

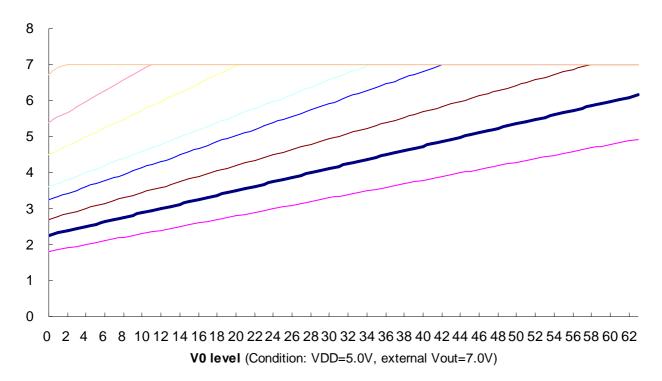

Rab2	Rab1	Rab0	1+Rb/Ra
0	0	0	1
0	0	1	1.25
0	1	0	1.5
0	1	1	1.8
1	0	0	2
1	0	1	2.5
1	1	0	3
1	1	1	3.75

#### The recommended curve: follower = 04H

#### Notes:

- 1. Vout  $\ge$  V0  $\ge$  V1  $\ge$  V2  $\ge$  V3  $\ge$  V4  $\ge$  Vss must be maintained.
- 2. If the calculation value of V0 is higher than Vout, the real V0 value will saturate to Vout.
- 3. internal built-in booster can only be used when OPF1=0,OPF2=0.

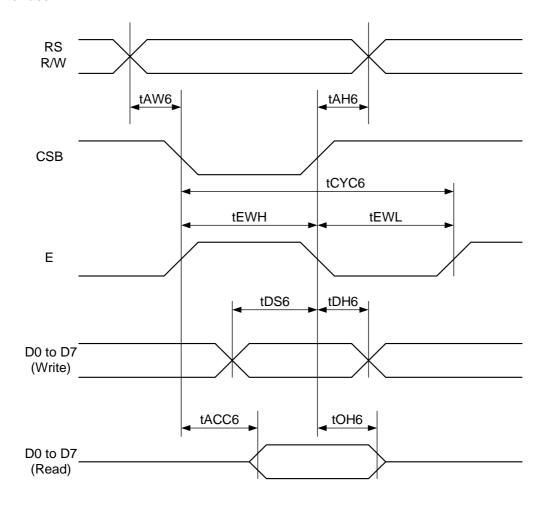

#### The recommended curve: followe=01H

#### Notes:

- 1. Vout  $\ge$  V0  $\ge$  V1  $\ge$  V2  $\ge$  V3  $\ge$  V4  $\ge$  Vss must be maintained.
- 2. If the calculation value of V0 is higher than Vout, the real V0 value will saturate to Vout.
- 3. internal built-in booster can only be used when OPF1=0,OPF2=0.

# ■ Application Circuit (Normal mode)

- > Use internal resistor(9.6K ohm) and contrast adjust with external VR.
- > Booster always off.
- ➤ Has 240 character of CGROM.
- Internal oscillator.

# ■ Application Circuit(Extension mode)

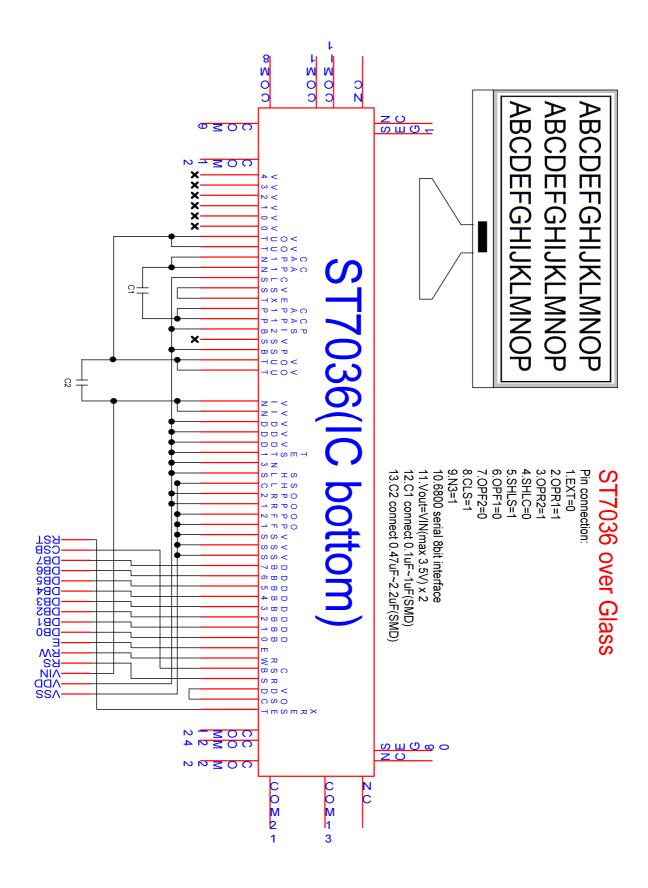

- > Use internal follower circuit.
- > Booster has 2 times pump.
- ➤ Has 240 character of CGROM.
- Internal oscillator.

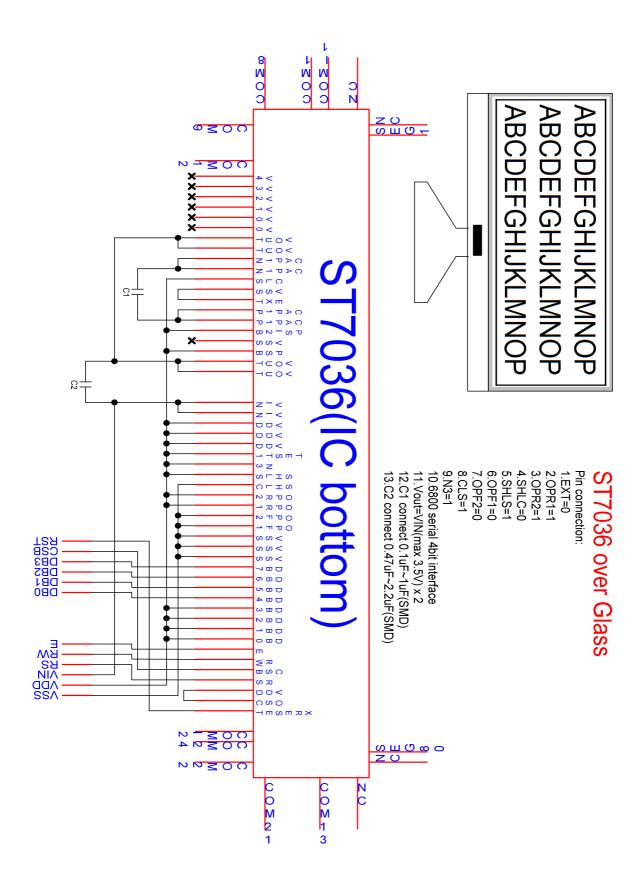

When the heavy load is applied, the dotted line part could be added.

# ■ Application Circuit (for glass layout)

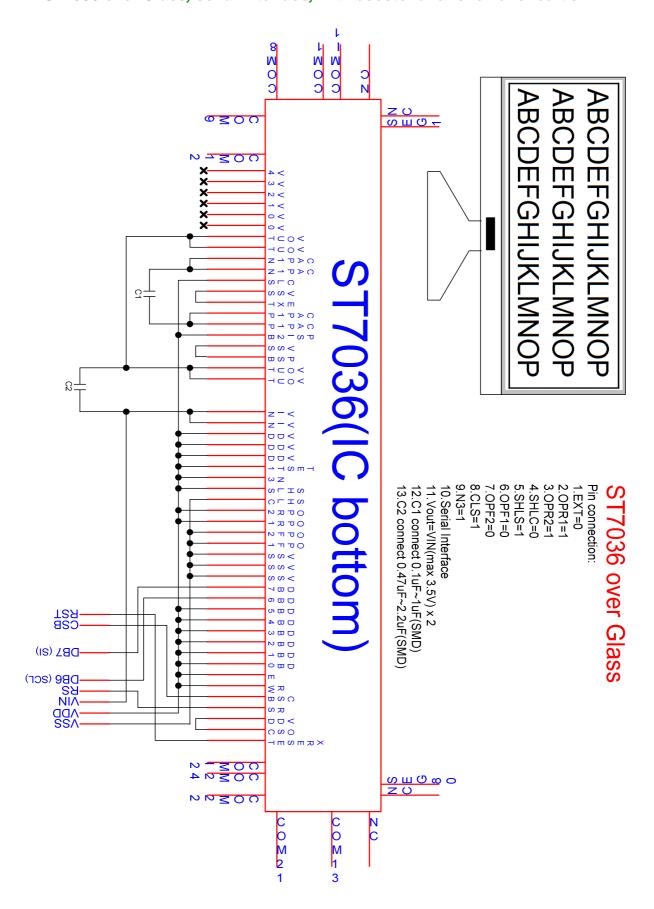

• ST7036 over Glass,6800 serial 8bit interface, with booster and follower circuit on

ST7036 over Glass,6800 serial 4bit interface, with booster and follower circuit on

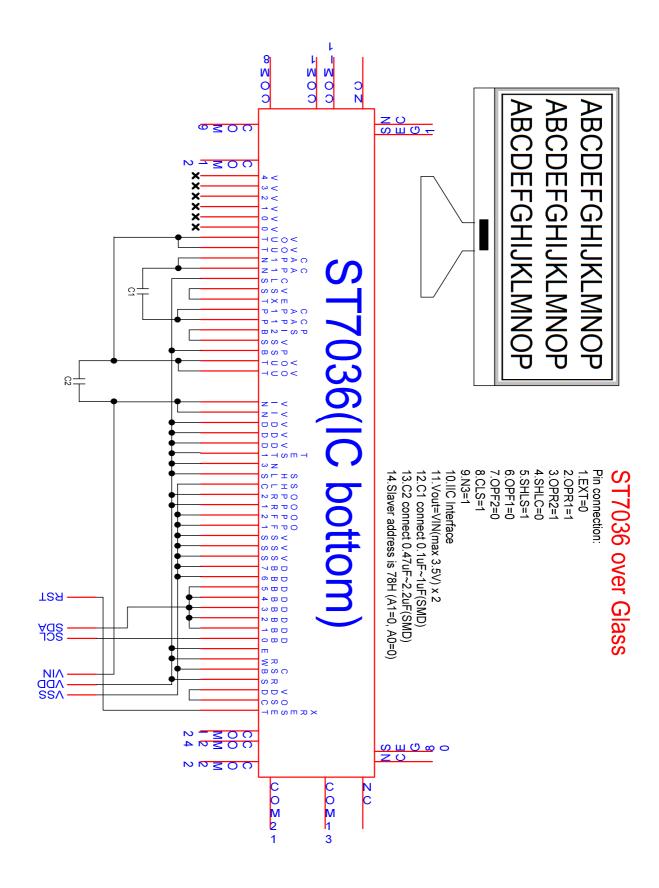

ST7036 over Glass, serial interface, with booster and follower circuit on

# • ST7036 over Glass, I<sup>2</sup>C interface, with booster and follower circuit on

In I2C application, note that the impedence of SDAs and GNDs should be keep in the POWER PIN LEVEL.

# **User's Guide**

# LCD Safe Handling Procedure

For product support, contact

Newhaven Display International 2511 Technology Drive, #101 Elgin, IL 60124 Tel: (847)844-8795 Fax: (847)844-8796

# **USING LCD MODULES**

# LIQUID CRYSTAL DISPLAY MODULES

LCD's are composed of glass, liquid crystal fluid, and a polarizer. Please pay attention to the following items when handling:

- 1. Keep the temperature within a specified range for use and storage. Polarization degradation, bubble generation or polarizer peel-off may occur with high temperatures and high humidity.
- 2. Do not touch, push or rub the exposed polarizer with anything harder than an HB lead pencil (glass, tweezers, etc).
- 3. N-hexane is recommended for cleaning the adhesives used to attach the front/rear polarizer. Reflectors made of organic substances will be damaged by chemicals such as acetone, toluene, ethanol and isopropyl alcohol.
- 4. If the display surface becomes contaminated, breathe on the surface and gently wipe it with a soft dry cloth. If it is heavily contaminated, wipe it gently with absorbent cotton or another soft material like a chamois soaked in Isopropyl alcohol or Ethyl alcohol. Scrub gently to avoid damaging the display surface.
- 5. Wipe off saliva or water immediately! Contact with water over a long period of time may cause deformation or color fading.
- 6. Avoid contact with oil or any greasy substances.
- 7. If there is condensation on the surface and contact with the terminals while cold, it will damage, stain or dirty the polarizer. After the product is tested at a low temperature, they must be warmed up in a container before being exposed to room temperature environments.
- 8. Do not put or attach anything on the display area in order to avoid leaving marks.
- 9. Do not touch the display with bare hands. This will stain the display area and degrade the insulation between terminals. (Some cosmetics are detrimental to the polarizer).
- 10. Exercise care to minimize corrosion of the electrode. Corrosion of the electrodes is accelerated by water droplets, moisture condensation or a current flow in a high-humidity environment.
- 11. As glass is fragile, care should be taken to avoid chipping, while handling the edges especially.

# PRECAUTIONS FOR HANDLING LCD MODULES

Since the LCD module has been assembled and adjusted with a high degree of precision, avoid applying excessive shock or force to the module or making any alterations or modifications to it.

- 1. Do not alter, modify or change the shape of the tab on the metal frame.
- 2. Do not make extra holes on the printed circuit board, modify its shape or change the positions of components to be attached.
- 3. Do not damage or modify the pattern wiring on the printed circuit board.
- 4. Absolutely do not modify the zebra rubber strip (conductive rubber) or heat the seal connector!
- 5. Except for soldering the interface, do not make any alterations or modifications with a soldering iron.
- 6. Do not drop, bend or twist the LCD module. In particular, don't forcibly pull or bend the I/O cable or backlight cable.

7. In order to avoid cracking the FPC, pay attention to the area where the FPC is bent, the edge of the overlay, the area of the surface of Ni-Au plating, the area of soldering land, and the area of the through hole.

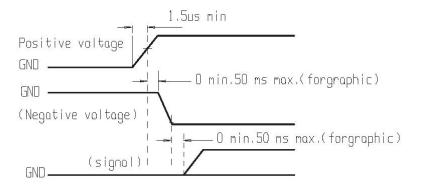

#### ELECTRO-STATIC DISCHARGE CONTROL

Since this module uses a CMOS LSI, give the same careful attention to the electrostatic discharge as you would for an ordinary CMOS IC.

- Make sure you are grounded when handling LCD modules. To minimize the performance degradation
  of the LCD modules resulting from destruction caused by static electricity, exercise care to avoid
  holding the following sections when handling the modules: exposed area of the printed circuit board,
  terminal electrode sections.
- 2. Before removing the LCD module from its packing case or incorporating it into a set, be sure the module and your body have the same electric potential.
- 3. When soldering the terminal of the LCD module, make sure the AC power source for the soldering iron does not leak.
- 4. When using an electric screwdriver to attach the LCD module, the screwdriver should be of ground potentiality, to minimize any transmission of electromagnetic waves producing sparks coming from the commutator of the motor.
- 5. As far as possible, make the electric potential of your work clothes and that of the work bench the ground potential.
- 6. To reduce the generation of static electricity, be careful that the air in the working environment is not too dry. (A relative humidity of 50-60% is recommended).

# PRECAUTIONS FOR OPERATION

- 1. Viewing angle varies with the change of liquid crystal driving voltage (VO). Adjust VO to show the best contrast.
- 2. Driving the LCD in the voltage above the limit shortens its life.
- 3. If the LCD modules have been operating for a long time showing the same display patterns, the display patterns may remain on the screen as ghost images and a slight contrast irregularity may also appear. A normal operating status can be regained by suspending use for some time. It should be noted that this phenomenon does not adversely affect performance reliability.
- 4. Response time is greatly delayed at temperatures below the operating temperature range, however this does not mean the LCD will be out of order. It will recover when it returns to the specified temperature range.
- 5. If the display area is pushed hard during operation, the display may become abnormal, however it will return to normal if it is turned off and then turned back on.
- 6. Condensation on terminals can cause an electrochemical reaction disrupting the terminal circuit, therefore it must be used under the relative condition of 40°C, 50% RH.
- 7. When turning the power on, input each signal after the positive/negative voltage becomes stable.

#### **STORAGE**

WHEN STORING LCD'S, THE FOLLOWING PRECAUTIONS ARE NECESSARY:

- 1. Store them in a sealed polyethylene bag. If properly sealed, there is no need for desiccant.
- 2. Store them in a dark place; do not expose them to sunlight or fluorescent light. Keep the temperature between 0°C and 35°C.
- 3. The polarizer surface should not come in contact with any other objects. (We advise you to store them in the container in which they were shipped).
- 4. Environmental conditions:
  - A). Do not leave them for more than 160 hours at 70°C
  - B). They should not be left for more than 48 hours at -20°C

# **SAFETY**

- 1. It is recommended to crush damaged or unnecessary LCDs into pieces and wash them off with solvents such as acetone and ethanol, which should later be burned.
- 2. If any liquid leaks out of a damaged glass cell and comes in contact with the hands, wash off thoroughly with soap and water.

#### LIMITED WARRANTY

Newhaven Display MAKES NO WARRANTY RESPECTING THE MERCHANTABILITY OF THE PRODUCTS OR THEIR SUITABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR USE OR RESPECTING INFRINGEMENT. Newhaven Display's liability arising out of any sale of products to Customer is expressly limited to repair and/or replacement of such Products, at Newhaven Display's election, with such remedies exclusive and in lieu of all others. Newhaven Display will not be responsible for any subsequent or consequential events or injury or damage to any personnel or user including third party personnel and/or user. This warranty is in lieu of any and all other warranties, whether oral, written, expressed, implied or statutory. Implied warranties of fitness for a particular purpose and merchantability are specifically excluded and shall not apply. Customer's obligations and Newhaven Display's remedies with respect to defective or nonconforming products, are solely and exclusively as stated herein. Furthermore, no warranty will apply if the Product has been subject to misuse, static discharge, neglect, accident, modification, or has been soldered or altered in any way or if any of the LCD handling precautions have been disregarded. Broken glass, scratches on polarizer, mechanical damages, as well as defects that are caused by accelerated environment tests are excluded from warranty. In returning products, they must be returned in their original packaging. If the original packaging is not used, the returned product must be properly packaged to prevent damage or warranty will be void. There must be a detailed description of the failures or defect for each returned part.

### RETURN LCD MODULES UNDER WARRANTY

The Customer must notify Newhaven Display within one year from date of shipment of any defective product. If Newhaven Display agrees to accept a return, return freight charges may be paid by Newhaven Display. Newhaven Display will not accept COD shipments. Contact a sales representative for a Return Materials Authorization Number and addressing instructions prior to returning product.

# **Handling Precautions**

#### 1. Limitation of Application:

Newhaven products are designed for use in ordinary electronic devices such as business machines, telecommunications equipment, measurement devices..etc. Please handle the products with care. (See below)

Newhaven products are not designed, intended or authorized for use in any application which the failure of the product could result in a situation where personal injury or death may occur. These applications include, but are not limited to: life-sustaining equipment, nuclear control devices, aerospace equipment, devices related to hazardous or flammable materials...etc. (If Buyer intends to purchase or use the Newhaven products for such unintended or unauthorized applications, Buyer must secure prior written consent to such use by a responsible officer of Newhaven Display). Should Buyer purchase or use Newhaven products for any such unintended or unauthorized application (without such consent), Buyer shall indemnify and hold Newhaven and its officers, employees, subsidaries, affiliates and distributors harmless against all claims, costs, damages and expenses, and reasonable attorney's fees, arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Newhaven was negligent regarding the design or manufacture of the part.

#### 2. Industrial Rights and Patents

Newhaven shall not be responsible for any infringement of industrial property rights of third parties in any country arising out of the application or use of Newhaven products, except which directly concern the structure or production of such products.

# Do Not Press!

# If pressure is applied to LCD, orientation may be disturbed. The LCD can be broken by shock!

# Don't Swallow or Touch Liquid Crystal!

Liquid Crystal may leak if the display breaks. If it accidentally gets on your hands, wash them with soap and water!

#### Do Not Scratch!

# No DC Voltage to LCD!

DC voltage or higher voltage than specified will reduce the lifetime of the LCD.

# Do Not Put Pressure on the Metallic Frame or Disassemble the LCD Module

Pressure on the metallic frame and PCB may deform the conductive rubber or break the liquid crystal cell and backlight, which will cause defects.

LCD may be shifted or conductive rubber may be reshaped, which will cause defects.

# Slowly Peel Off Protective Film!

Avoid static electricity.

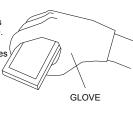

# **Avoid Static Electricity!**

# Please be sure to ground human body and electric appliances during work. It is preferable to use a conductive mat on the table and wear cotton clothes or conduction processed fiber. Synthetic fiber is not recommended.

# Wear Gloves While Handing!

It is preferable to wear gloves to avoid damaging the LCD.

Please do not touch electrodes with bare hands or leave any residue.

# Keep Away From Extreme Heat and Humidity!

# **Use Alcohol to Clean Terminals!**

When attaching with the heat seal or anisotropically conductive film, wipe off with alcohol before use.

# Don't Drop Water on LCD!

Note that the presence of waterdrops or dew in the LCD panel may deteriorate the polarizer or corrode the electrodes.

# **Precaution in Soldering LCD Module**

Basic instructions: Solder I/O terminals only.

Use soldering iron without leakage.

(1)Soldering condition to I/O terminals

Temperature at tip of the iron: 280±10°

Soldering time: 3~4 sec.

Type of solder: Eutectic solder (containing colophony-flux)

\*Do not use flux because it may soak into the LCD Module or contaminate it.

\*It is preferable to peel off protective film on the display surface after soldering I/O terminals are complete.

(2)Remove connector or cable

\*When you remove connector or cable soldered to I/O terminals, please confirm that solder is fully melted. If you remove by force, electrodes at I/O terminals may be damaged(or stripped off).

\*It is recommended to use a solder suction machine.

#### **Long-term Storage**

If it is necessary to store LCD modules for a period of time, please comply with the following procedures.

If storage conditions are not satisfactory, the display(especially polarizer) or soldering I/O terminals may become difficult(some oxide is generated at I/O terminals plating).

- 1.Store as delivered by Newhaven.
- 2.If you store it unpacked, put it in an anti-static bag, seal its opening and store where it is not subjected to direct sunlight or fluorescent light.
- 3.Store at temperature 0 to +35° and at low humidity. Please refer to our specification sheets for storage temperature range and humidity conditions.

# **Long-term Storage**

Please use power supply with built-in surge protection circuit.
